SEE AMERICA / WHITE SANDS

Research companion | live presentation URL will be added after GitHub Pages deployment.

The landscape

The White Sands gypsum dunefield extends across more than 275 square miles in the Tularosa Basin. The national park protects part of this landscape.

Life in the dunes

Research subjects include pale-colored lizards, kit foxes, native grasses, soaptree yucca and wildlife tracks. Species and image identifications require verification.

Ancient tracks

Human footprints preserved in sediments associated with ancient Lake Otero have been dated to approximately 21,000–23,000 years ago.

Night sky and military history

White Sands National Park is distinct from White Sands Missile Range. The Trinity test took place on July 16, 1945, at a site now within the missile range.

Visiting

Alamogordo is the nearest major service center. Hiking, sledding and ranger programs are featured in the supplied research. Check official access conditions.

Design study

The visual study examines WPA-era travel poster composition, geometric reduction, color restrictions and typographic hierarchy.
